

SIP Trunking

Benefits:

• Innovative

ABS specializes in cloud-based application development tailored to build efficiencies within your business

• Intelligent

ABS takes into account all aspects of your business when designing your cloud-based solution

• Accountable

At ABS we want to be held accountable for the success of your project

• Forward-Looking

ABS designs solutions that will enhance your business today and scale with you into the future

• Customer-Centric

Everything that we do at ABS starts and ends with customer satisfaction

The New Standard: With the emergence of low-cost broadband and VoIP-enabled data networks, SIP Trunking is rapidly becoming the standard for interconnecting premise-based phone systems to the public switched telephone network. American Broadband Services (ABS) SIP Trunking enables you to reduce phone and broadband charges by consolidating them into one affordable competitive package. This can be done easily while maintaining your current investment in your traditional PBX and digital phones.

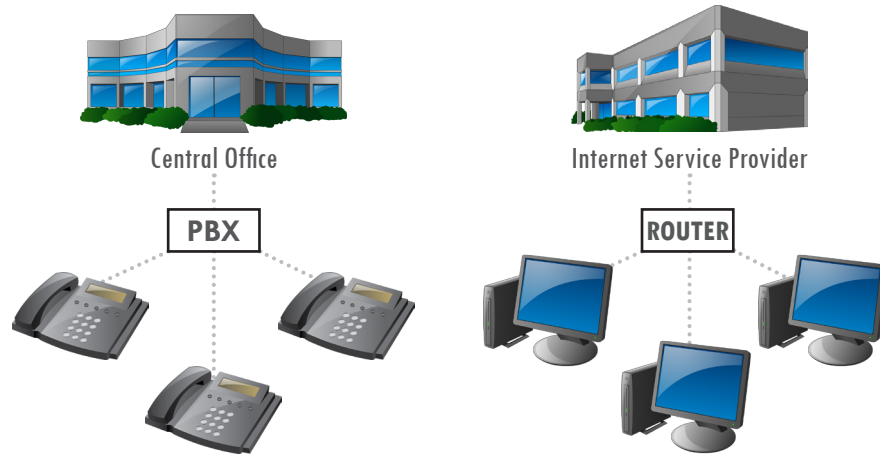

Affordability and Cost Savings: With ABS SIP Trunking, you can seamlessly and affordably transition to a cloud-based voice service without having to replace your existing legacy PBX. This enables you to retain your investment in digital phones while realizing the cost benefits of consolidating your voice and data services. In addition, your company can take advantage of the competitive long distance and toll charges offered by ABS SIP Trunking.

Business Continuity: Disasters happen. A hurricane, major power outage, or anything that forces your employees to work from an alternate location can be extremely disruptive to your business. Your company requires business continuity planning to ensure that customer calls do not go unanswered. By replacing your traditional phone lines with ABS SIP Trunking, you will be able to immediately redirect calls at the carrier level to a second physical location where your business can resume as normal.

Multi-Site Support: Whether your company has two or two thousand locations, ABS SIP Trunking can enhance the capabilities of your PBX. Your company's multiple locations can be included in the same enterprise, enabling extension-to-extension dialing regardless of their location—across the street or across the country. This allows your company to operate more efficiently and reduces the amount of abandoned calls and frustrated callers.

ABS's dedication to service and quality is what truly sets us apart from the competition. We aggressively recruit only the most skillful and talented team members who are dedicated to providing outstanding customer service. With a long history of helping others engineer highly technical solutions, our knowledgeable team is poised to assist you.

Outdated Costly Configuration

Typically: Legacy digital phones connect to a PBX, which consists of multiple line and station cards. The PBX then connects directly to your phone carrier via POTS, PRI, or Voice T-1 adding to the cost. Internet connectivity is usually handled separately by your ISP.

VS.

SIP Trunking: A router is placed between your current legacy PBX and your secure data connection to the ABS environment. The costly phone carrier and additional line can be removed from the equation, consolidating your communication charges and allowing you to take advantage of ABS's unparalleled features and rates.
