American Broadband Services Offers Hosted Voice Over IP Service

Fresno, CA January 3, 2006 – American Broadband Services (ABS), a national provider of private broadband networks for businesses, announced the availability of hosted VoIP (Voice Over IP) services.

“Many companies have expressed dissatisfaction with the customer service they were having on their hosted VoIP service. They liked the network and features, but were unhappy with the customer service they received”, stated Brian Watters, ABS Director. “We have always received high marks for our customer service, so we put together our own hosted VoIP Service. We first did test installations and are now fully launched with several customers on it already. Our service provides a superior service and features package than any of our competition”.

Marketed under the name VoIPZone Enterprise, customers pay a low monthly fee per “seat”, typically an IP telephone. This seat comes with a full feature set, allowing standard features such as intercom and voice mail, but is greatly enhanced with newer advancements, such as “find me-follow me” so that people do not have to be strapped to their desks to be reached. One number is given to their clients and the system will locate them at their desk, at home, on their cellular phone, no matter where they are.

Additionally, the seat price includes unlimited calling throughout the United States and Canada at no additional cost. International calls are very inexpensive as well.

Per Mr. Watters, “Hosted VoIP is a growing market, and while it may never replace all the legacy PBX’s, it will make serious inroads over the next few years, because

customers no longer need to make huge investments in PBX's and no need for expensive annual support contracts.”
